#### 1. Context

Recent advances in Large Language Models (LLMs) have improved conversational agents' realism and compliance towards human requirements and needs. However, controlling conversation flow towards positive outcomes remains crucial.

This Ph.D. aims to represent conversational knowledge using an ontology to enable language model control. Ontologies allow to model the knowledge in a domain, defining concepts and characterizing relations between them. While often used for domain-specific knowledge, few have explored using ontologies to guide conversation flow. Convology is a recent example focusing on managing health conversations. We plan to extend Convology's conceptualization capacities to a more general setup, therefore adaptable to general-purpose user/agent conversations.

## 2. Methodology

PhDapproach. Iterative process progressive enrichment of the ontology conceptualize more and more notions related to conversations.

Tools. Protégé, HermiT and Pellet reasoners, PyTorch, huggingface rdflib, owlready2, transformers parameter-efficient fineand tuning libraries, LoRA adapters.

#### Conceptualization. Progressively

incorporate and infer on linguistic features such as part-of-speech tags, affective computing such as emotions or dialog acts.

Experimental setup. Toy example design process is a trial and error approach?

Control. Explain how we plan to control the conversational dynamic in the context of a dialogue user-agent.

Challenges. It is not straightforward that the knowledge the ontology brings can be accurately learnt and applied by a language model, whether it be decoder-only or encoder-decoder.

# 3. Motivation & Objectives

The objective of this thesis is to develop knowledge-enhanced conversational models that exploit Large Language Models (LLMs) and Ontologies. This consists in improving stateof-the-art LLMs by providing structured knowledge to open-domain conversational agents.

### Objectives:

- Build conversation ontology for interpersonal that accounts relationships concepts and their evolution.
- Integrate ontology and assess understanding during fine-tuning.
- Bring control on conversational LLM outputs through encapsulated conversation knowledge.

Figure 1: The benefits of ontology-LLM hybridation systems for conversation modeling

# 4. OntoGPT: LLM Fine-Tuning Based on Ontology Validation

An end-to-end integration pipeline where the ontology information is assimilated at fine-tuning time.

## 5. Advances & Perspectives

Key findings in LLMs:

- Challenges to setup the fine-tuning procedure
- Computational time

Advances in ontology building:

- Advance 1
- Advance 2
